

Instructions - PPM condition

Instructions

(page 1 out of 5)

In this experiment, you will answer 10 questions in total.

In each question, there are two new boxes, which contain yellow (●) and blue (●) balls in different proportions.

A picture like the one below will give you information on the boxes:

Numbers may change in each question. But, following is always true:

...Left box always contains more than half of all ●

...Right box always contains more than half of all ●

...Both boxes always contain 100 balls each.

In the example above, if left box contains 68 ● and 32 ●, right box contains 52 ● and 48 ●

Instructions

(page 2 out of 5)

In each question, one of the boxes is the 'actual box'.

The actual box is predetermined by an unbiased coin flip. It is same for all participants, including you.

A ball will be drawn randomly from the actual box for you. Following is an example draw:

Note that...

...if you draw , Left box is more likely.

...if you draw , Right box is more likely.

The color of your draw helps you guess the actual box.

Instructions

(page 3 out of 5)

To see the color of your draw, you need to complete an **effort task**.

You will first see the following question:

Would you like to work on the effort task?

Yes

No

If you select 'Yes', you will be presented a table as below:

0	0	0	1	0	0
0	0	0	0	1	1
1	0	0	1	1	0
1	0	1	0	1	0

Your task is to count the number of 0s.

There is no time limit. You can try multiple times.

Once you submit the correct answer, you observe your draw.

You may skip the effort task by selecting 'No'. Then, you will not see the color of your draw.

Instructions

(page 4 out of 5)

Finally, you will pick one of the boxes. The question will appear as below:

Which box do you pick?

100 balls
More than 60 

100 balls
More than 40 

You may click on...

Left box if you pick Left box

Right box if you pick Right box

Your pick will be submitted when you click

Submit

Which box do you pick?

100 balls
More than 60 

100 balls
More than 40 

You may tap...

Left box if you pick Left box

Right box if you pick Right box

Your pick will be submitted when you tap

Submit

Instructions

(page 5 out of 5)

You will earn £2 bonus, on top of £1.25, for completing the experiment.

In addition, you may earn bonus from each question.

Let's see how it works with the example boxes:

100 balls
More than 60 

100 balls
More than 40 

Total : 120  , 80 

There will be at least 50 other participants in the experiment.

After the experiment, we calculate the percentage of participants other than you who pick each box.

We compare those percentages to the numbers in .

Suppose 79% picked Left, 21% picked Right. Then,...

...you win $79 - 60 = 19\text{p}$ if you picked Left

...you lose $40 - 21 = 19\text{p}$ if you picked Right

So, **you win money if you pick the box that others will pick more often than indicated in** .

The color of your draw helps you guess others' draws, which may affect their picks.

The maximum total gain from your picks is +£2 and the maximum total loss is -£2.

So, your total reward at the end of the experiment is between £1.25 and £5.25.
